The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIGITG-ABLIGOTI), expressed DNA sequences (ABLO1840-ABLIGTS) and the encoded proteins (ABBS7037-ABB72072).

The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic a genes from Drosophila interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Drosophila melanogaster.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         23-MAR-2001; 2001WO-US09231

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptide is useful for expanding an endogenous population of proliferative cardiomyocytes in a heart tissue, promoting proliferation of a cardiomyocyte in a mammal having myocarditis or that which has suffered myocardial infarction and for regenerating cardiomyocytes in vivo. DNA encoding a CHF-1 polypeptide is also useful for promoting proliferation of a cardiomyocyte, regenerating cardiomyocytes in vitro, inhibiting angiogenesis in a tissue, inducing differentiation of smooth muscle cells in a mammalian tissue, preferably venous tissue, inducing growth of smooth muscle cells in a vein explant, promoting smooth muscle cell regeneration in an injured or diseased vascular tissue (venous or arterial) and for reducing vein graft stenosis in a mammal by contacting the tissue ex vivo with the DNA prior to implantation of the tissue into an artery of the mammal. The present sequence represents the hairy protein from Drosophila, with which CHF-1 shares homology.
                                                                                                                                                                                                                                       Streptomyces sp. CHF is a transcription factor expressed in cardiovascular tissue, which contains a basic helix-loop-helix domain. CHF-1 shares structural homology with hairy, a Drosophila protein essential for the development of the peripheral nervous system. The CHI

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     sequences encoding them have cardiant, osteopathic and cytostatic activities. The genes are applicable in producing e.g. ubiquitone, vitamin K2 and carotenoids which can be used in the treatment of heart diseases, osteoporosis and cancer in drugs and health foods. The present sequence represents the orfB protein from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence given in AAH44043 represents a DNA sequence isolated from Streptomyces sp. CL190, containing a base pairs (S1), which encodes the whole enzyme necessary for functioning the mevalonate pathway. The sequence encodes protein sequences, designated orfa to E and hmgr, which are used in the mevalonate pathway. The proteins and polynucleotide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Actinomycetes-originated genes of enzymes participating in mevalonate pathway, applicable in producing e.g. ubiquitone, vitamin K2 and carotenoids for treatment of heart diseases, osteoporosis and cancer.

                                                                    mitted (AFR-2001) to the EMBL/GenBank/DDBJ databases. FUNCTION: Adapter involved in the TLR4 signaling pathway in the innate immune response. Acts via IRAK2 and TRAF-6, leading to the activation of NF-kappa-B, MAPKI, MAPK3 and JNK, resulting in cytokine secretion and the inflammatory response (By similarity). SUBUNIT: Homodimer. Also forms heterodimers with MyD88. Binds to TLR4 and IRAK2 via their respective TIR domains. Binds to PKR. Does not interact with IRAK1-1, nor TLR9. SUBCELLULAR LOCATION: Cytoplasmic (By similarity). SIMILARITY: CONTAINS 1 TIR DOMAIN.

Chem. 274:26543-26549(1999).

FUNCTION: THIS IS CALCIUM-INDEPENDENT, PHOSPHOLIPID-DEPENDENT,

SERINE- AND THREONINE-SPECIFIC ENZYME.

ENZYME REGULATION: ACTIVATED BY DIACYLGLYCEROL AND PHORBOL ESTERS.

PTM: Autophosphorylated.

SIMILARITY: CONTAINS 2 ZINC-DEPENDENT PHORBOL-ESTER AND DAG
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       BINDING DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            FUNCTION: Riboflavin synthase is a bifunctional enzyme complex catalyzing the formation of riboflavin from 5-amino-6-(1'.D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dihydrohy-2-butanone-4-phosphate via 6,7-dimethyl-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'.D)-ribityl-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dihydrohy-2-butanone-4-phosphate yielding 6,7-dimethyl-8-lumazine (By similarity).

CATALYTIC ACTIVITY: 2 6,7-dimethyl-8-(1-D-ribityl)lumazine riboflavin 4-(1-D-ribitylamino)-5-amino-2,6-dihydroxypyrimidine.

PATHWAY: Riboflavin biosynthesis; last step.

SIMILARITY: BELONGS TO THE DWRL SYMTHASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SWISS-PROT entry is copyright. Proc. Natl. Acad. Sci. U.S.A. 98.9877-9882(2001).

-!- CATALYTIC ACTIVITY: ATP + sulfate = diphosphate + adenylylsulfate.
-!- PATHWAY: FIRST STEP IN THE SULFATE ACTIVATION PATHWAY. THIS
REACTION OCCURS EARLY IN THE REDUCTIVE BRANCH OF THE CYSTEINE
BIOSYNTHETIC PATHWAY.
-!- SUBUNIT: HETERODIMER COMPOSED OF CYSD, THE SMALLER SUBUNIT, AND
CYSN (BY SIMILARITY).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MYCTU
